Note: As shown in green, there is a direct relationship between the percentage of units with a regulatory status of “free market” and price per square foot. Likewise, the low cap-rate trades occurred in the under \$400/square foot range. Both logical relationships are apparent per the table above.

Commentary from the front lines...

We are clearly starting to see the market come alive as indicated by both the volume of trades and the transaction metrics of the above select transactions in June, not one of which, traded above a 5% cap. After a long 14 – 15 months of stagnation and uncertainty starting at the beginning of the pandemic, there is a palpable aggressiveness emerging on the buy side.

We are hearing from our clients that while residential rents have not recovered yet, leasing has picked up and people are rapidly filling residential vacancies in preparation for a return to the office in the fall. On the commercial front, as people are becoming more comfortable with going out retailers are making more sales and retail rent collections are improving.

There are still plenty of questions ahead regarding legislation and the potential for a Covid 19 resurgence. From a legislative standpoint, the market players seem to have their eyes on the good cause eviction bill, capital gains tax increases and the possible elimination of the 1031 exchange.
